This should be really easy. How do you print something (to the normal print window in IDL) without a carriage return?

I have a routine that is doing many calculations, and every once in a while i just want to print a dot, so I can see the calculation progressing. Anyone know a simple way to do this?

```
(i.e.,  
print, 'Calculating', format='(no carriage return)'  
for i = 1,100 do begin  
    Calculate_hard_Thing, i  
    print, '.', format='(no carriage return)'  
endfor  
)
```
