Yes. But...

You can "compile" applications into .sav files which will run using the IDL runtime engine. The IDL runtime engine is included with IDL and IDL would have to be installed on target machine. RSI may license runtime only versions of IDL which would allow you to install only the runtime engine at a reduced cost but, I am not sure.

There is also the ability to compile a stand alone application which requires no runtime license and is called embedded IDL. But my brief conversation about this led me to believe that this is a very expensive route not suitable for people in the .edu or .gov world.
