I have recently follow a course on interactive direct graphics and object graphics. Wonderful new opening in the IDL world for me. Since this course, I am wondering how to include the drawing widget into Powerpoint to be able to interact with in while doing a PPT presentation?

I believe I have to import the widget as an object in PPT using the IDLDrawWidget command, but do I need an interface in Visual Basic? Anybody out there has succesfully master this question before?

Thanks in advance,

Bertrand Timbal (Bureau of Meteorology, Australia)
