
Subject: vector C++ version of IDL where statement?

Hi,
this is a hybrid C++/IDL newsgroup question, but I shall risk your
wrath:

Does anybody know how to do an IDL WHERE statement in C++ ??

e.g.
IDL> x=findgen(100)
IDL> w=where(x gt 50)
IDL> x(w)=50

how do you convert to C++?

```
#include<vector>
main(){
    vector<double> x(50);
    for (int i=0; i<50; i++) x[i]=i;

?????? <- what to put here?
```

Muchos gracias,

Sean
