I'm having problems with the 'atan' function in IDL 5.5. I have a program which reads in an array of complex numbers, so an array of single numbers should be produced, but in fact another complex array is produced. At the command-line the atan of a set of complex numbers produces a single number. I have disabled the multi-threading option with no effect. I'd appreciate any advice on this matter.

<p>Many thanks,

<p>Zoe
