For interactive-mode stuff (which seems to be what you're interested in), I just use the command recall facility. I have a pair of short procedures that set and reset the graphics device to PostScript, so it's just a matter of doing:

- 1) Create graphic on-screen
- 2) run 'pso' (for PostScript Open)
- 3) Recall the command(s) that create the graphic
- 4) run 'psc' - which even sends the PostScript file off to the printer.

I posted 'pso' and 'psc' awhile ago, they're also available via ftp from 'helix.nih.gov' in '/nmrctr/misc_idl'
