Hot on the heels of the large IDLWAVE 4.13 release, which
was haunted by triskaidekaphobia, version 4.14 cleans up a
few of the new features and includes a few bug fixes:

* Better handling of multiple *Examine* buffer windows,
  allowing you to resize them without it being auto-sized on
  each examine. A frame containing *Examine* with only one
  window will be used preferentially.
* Key commands "c" and "q" clear the old contents and close
  the current *Examine* window, respectively.
* Continued statements at the end of continuation lines, ala:

    a=1 & b=2 & frobnicate, a, $
                  b
  now have indentation correctly calculated.
* Class-qualified method procedure calls now have continued
  indentation correctly calculated:

    object->myClass::theMethod, a, $
                    b

As usual, you can find the updates, and the answers to life,
and how to live it, at http://idlwave.org.

Enjoy,

JD
