Dear all,
   Hope someone can help us with this one. We have a IDL program
which allows user to rotate, rescale a 3D mesh interactively. It is
running well in window. However, it becomes extremely slow on Linux.
It is almost useless. I am wondering if we can speed up this program
on Linux. I have found that a lot of people has the same problem. I
just want to make sure whether there is a solution beside buying a
windows IDL lincense.

Sam
