Okay, now I guess I understand. Actually you fooled me, I thought the beautiful flower was the right answer. :-)

Let me say that I think that the Windows/Mac approach, while it may be neat/keen, is just plain wrong. It's documented nowhere! The system documentation for DEVICE, DECOMPOSED=1 mentions nothing about such a transformation. There should be a documented flag to enable this, and then it should work consistently across platforms, darnit!

Craig
