Subject: how to debug floating error

Hi, there,

I made a program to do the FFT analysis of an image. After the program terminated, there are some error information printed in the log window:

"

% Program caused arithmetic error: Floating underflow

% Program caused arithmetic error: Floating overflow

% Program caused arithmetic error: Floating illegal operand

"

The program can run till the end of it. And only these error informations are displayed. How can I know where these errors occur? How can I debug them out?

Any suggestion will be appreciated,

Julia
