David's solution is the correct one. The quick and dirty solution is to put:

forward function findroots

within PRINT TO FILE, before the first reference to FINDROOTS() is made.

The problem is that IDL doesn't know whether you are referring to an function or an array, since both are accessed using the () notation. Since you didn't keep FINDROOTS in its own self-named file, IDL won't know about it and assume that references to FINDROOTS are array references. The above hint helps IDL decide.

Good luck, Craig
