-I`ve created a Base with Text and Label widgets inside. I want it (the
base) to enable/desable with a pressButton so all the widgets inside
become 'false sensitive'. It works as long as the Base is set to
'sensitive=true' in the properties of the .prc file. But when set to
'false', it becomes impossible to make the Base enabled. Is it normal
and if yes, is there another way to make it?

Thank you
Peter
