I think you want to use something like this:

```
tlb = widget_base(/row)
base1 = widget_base(tlb,/column)        ;first column
base2 = widget_base(tlb,/column)        ;second column
base3 = widget_base(tlb,/column)        ;third column
```

Now add buttons, etc. to base1, base2, or base3 to put them into the columns
you want.
The top level base is a row of columns.

Don
