
Subject: IDL-mapping Stereographic Projection

Has anyone figured out how to produce a polar stereographic projection in IDL and specified the map limits so that the projection pole is not in the center of the generated map. In other word I want a subsection of a map where the map center is not in the projection center. Playing with the map limits in map_set only produces 'Pie-Charts' or 'Donuts' and the clipping key-word is not allowed in map set.

Thanks Axel
