Hi,

I am having difficulty with widget events, using the Ctrl button (modifier value of 2). In my code if I replace the (ctrl button with the alt button it works as I want, just with alt instead of ctrl on a Windows machine, but it does not work properly under linux), in fact the following line of code causes IDL to complete fail and close on linux.

```
ENDIF ELSE IF (event.modifiers EQ 8 OR event.modifiers EQ 2) THEN BEGIN
```

Is there another way to find out if a button is being pressed, without using modifiers?

Thanks,
Mira
