
Subject: IDL FFT vs MATLAB FFT

Argh.... it is a bad day when I need to sort out both Matlab's and IDL's FFT functions...

Assuming that, IDL's FFT function uses a one-sided format, and divides by N on the forward transform and MATLAB's FFT function uses a one-sided format and divides by N on the inverse transform, I still am having difficulty comparing the FFT results from each.

In Matlab:

```
>> fft(eye(4))
```

```
ans =
```

```
1.0000 1.0000 1.0000 1.0000
1.0000 0 - 1.0000i -1.0000 0 + 1.0000i
1.0000 -1.0000 1.0000 -1.0000
1.0000 0 + 1.0000i -1.0000 0 - 1.0000i
```

```
IDL> print, 4*fft(identity(4),/double)
(1.00000000,0.00000000) (0.00000000, 0.00000000) (0.00000000,0.00000000)
0.00000000)
(0.00000000,0.00000000) (0.00000000,-3.0628711e-17) (0.00000000,0.00000000)
(1.00000000,3.0628711e-17)
(0.00000000,0.00000000) (0.00000000, 0.00000000) (1.00000000,0.00000000)
0.00000000)
(0.00000000,0.00000000) (1.00000000,-3.0628711e-17) (0.00000000,0.00000000)
(0.00000000,3.0628711e-17)
```

Can someone please explain how and why these are different?

Many thanks,
Randall
