
Subject: X-windows locking me out

Hi,
This is aimed at the VMS community out there!!!!

Is there a known bug using the sensitive=0 flag on a widget base under OpenVMS?

For instance, the following code:

```
Pro my_test
  tlb = widget_base(column=1)
  my_base = widget_base(tlb, column=1, sensitive=0)
  base2 = widget_base(my_base, row=1)
  pulld = widget_droplist(base2, value=['aaa','bbb'])
widget_control, tlb,/realize
widget_control,my_base,/sensitive
end
```

When I run the above under OpenVMS 7.1 and IDL 5.4 and select the drop-down list, each item is shown insensitive(greyed out). Surely this should be sensitive (as per the penultimate line). Furthermore, at this point the X-system locks up. I can no longer size the screen, close it, minimise it. All I can do is reboot - not exactly desirable.

Further investigation indicates that the software is expecting me to make a selection, but this is not possible because they are greyed out. Hence the systems is stuck on waiting for an event that can never occur.

I believe this is only a problem with VMS, as the same code runs as expected on NT

I CAN work round it by not making my_base insensitive, but all the lower widgets insensitive. However, in the real code, there is a large structure of widgets (base,buttons,pull-downs,etc) under this base, and in order to make them sensitive, I'd need to set each widget to sensitive individually - messy and time consuming.

I would be grateful for any suggestions.

Regards,
Ian
