The default color is gray95. To make it an 80% gray, instead of 95%, try (setq ps-zebra-color "grey80") in your .emacs. If you use the customization system (which differs a bit, depending on what emacs you are using - I'm using 21.2.1), you can set that interactively. If you run customize-apropos-group (also available in emacs 21.2 by mousing around to the Options->Customize Emacs->Groups Matching Regexp... menu), you'll find the zebra customization group.

I cannot reproduce your 3-line-zebra-strips-disappearing problem. Do you know about prefix arguments [1]? If you run ps-print-buffer-with-faces with a prefix argument, you'll be able to save the result to a file. To do that, use "C-u M-x ps-print-buffer-with-faces" instead of plain old "M-x ps-print-buffer-with-faces". That might help speed up your debugging and kill fewer trees.

Mike

[1] remember, emacs stands for Escape-Meta-Alt-Control-Shift (or Eats Memory And Constantly Swaps, but since we're talking idl here, that may not be fair ;-)
