
Subject: Question about configuring axes

Is there any simple way with IDL to plot something with an axis on which values decrease rather than increase? For instance when one uses pressure as the vertical coordinate to represent atmospheric structure, pressure decreases with height and therefore when pressure is used as the y-axis variable, the largest values of pressure are those at the bottom of the y-axis.

For instance...

600 -|
|
800 -|
|
1000 -

Thanks for any help,
Rob Kursinski
