Subject: dereferencing a pointer to an object array

Posted by Brent_griffith on Thu, 07 Nov 2002 23:58:04 GMT

greetings,

What is the trick to dereferencing a pointer to an Object array? I
want to keep track of an array of object references in another object.
 I don't know how many until runtime so I use a pointer to the object
array and store that in the managing object. But when I go to access
the thing, by dereferencing the pointer, the object array has the
right size but all the objects are null.

here is how I create and store the object array

```
    ZoneGroupObjs = objArr(self.numGroups)
    For i = 0, self.numGroups-1 do begin
       ZoneGroupObjs[i] = obj_new('ZoneGroup')
    endfor
    self.ZoneGroupObjs = ptr_new(ZoneGroupObjs)
```

Then to access the objarr inside another method..

```
    theseGroupObjs=*self.ZoneGroupObjs
```

But it doesn't work! Why?

Thanks!

Brent
