Subject: File_Which What!?

Posted by David Fanning on Thu, 21 Nov 2002 04:28:18 GMT

Folks,

Does anyone know how to get the File_Which command to work?
The documentation is, uh, typical.

I have a file somewhere on my IDL path. It's name is "fire.clt".
I'm in a directory NOT on my path (my home directory), but I
would like to know where this file is.

The documentation says that the first positional parameter
is the "path", and the second is the "file" you are searching
for. Then it says, if the "path" is missing, then the IDL
path is used instead. But, wait, if the first positional
parameter is "missing", isn't the "file" the first positional
parameter!? Here is a new trick!

In any case, File_Which is coming back to me with a
empty string. Not what I had in mind? :-(

Anyone figure this out?

Thanks,

David
