Hi, I'd like to open one file in a directory. For example,

```
openr,1,'d:\data\1.txt'
```

but next time maybe open 2.txt in that directory. I donot want to change the code every time. Are there any method when the program excute at openr, a window containing the files can jump out and then I can chose files in the directory to be opened? Somebody told me Matlab code:

```
[fname,fpath]=uigetfile('*.','Data'), but I donot use Matlab.
```

Best regards,

TOM
