Hello, all.

I can't seem to find anything in my documentation about whether IDL
has the bitwise operators AND, OR, NOT, and XOR.

Basically, I encode several different pieces of info into one byte,
and I need to AND the encoded byte with my various test bytes to see
whether the bit in my encoded byte corresponding to my test condition
is on.

Any suggestions, short of writing the function/procedure myself?

Thanks,

matthew
