I use,

```
#  
# Compile, one for each .c file.  
#  
cc -fPIC -no-cpp-precomp -dynamic -fno-common \  
-I/usr/local/rsi/idl_5.6/external      \  
-I..any other needed include paths      \  
-ansi -Wall -Wtraditional -Wundef      \  
-Wpointer-arith      \  
-Wcast-align -Wsign-compare      \  
-c -D_REENTRANT source_file.c      \  
-o source_file.o
```

```
#  
# Link to the .so.  
#  
cc -bundle -flat_namespace -undefined suppress \  
-o source_file.so source_file.o      \  
any_additional_objects.o      \  
any_additional_libs.a
```
