Subject: Keystroke events to a draw widget?

Hi people,   --regarding IDL widgets in X windows:

I can't find anything in the manual, so I doubt it's possible,
but can I set it up so that 'P' or 'ctrl-P' activates a menu
pick or acts like a button press?

I have experimented with GET_KBRD, but it requires the mouse
to be over a non-IDL window, and it is a gross misuse of stdin
to try to emulate event processing this way (really slows down
my main event loop).   Thanks,
            Russ Welti
