Subject: Issue Installing IDL 5.6 under Mac OS 10.2.3

I recently installed Mac OS 10.2.3 and so today I installed IDL 5.6. I
also installed Xdarwin and oroborosx 0.8b2 with the necessary patches
for 10.2.

I then set the environment variables by adding the path in my .tcshrc
file like the install manual stated. Logged out and back in.

But now when I go into oroborosx and try to run rsilicense or even idl
or idlde I get the error command not found. It seems like idl_setup is
not recognized. Now when I actually go into the directory and try to
run any of the above I get the same error.

I have installed IDL 5.6 on another machine with 10.2.2 and had no
problems. Could this be a 10.2.3 issue?

Anyone else have problems setting up the environment variables and
aliases for idl 5.6?

Thanks,'
Catherine
