
Subject: widget_table annoyance: how do i change the width of the row label header column?

I am running IDL 5.4 under Redhat Linux, and am using the table widget with mixed success. I am simply trying to make my row labels fit in the row label header column. It doesn't need to be huge - I just need to be able to fit about 12 characters there without them being cut off. However, the default width only fits about 9 characters, and this column does not seem to be affected by the column_width keyword. What am I missing?

Thanks,
Ben Knowles
