```
IDL> filename = Filepath(['examples','demo','demosrc'], 'd_filter.pro')  
IDL> Print, filename
```

Look on lines 545-564 of this file. You will find this:

```
case filtertype of  
    ; Define Butterworth filter types.  
    ;  
0: BEGIN  
    if (bandtype EQ 0) then begin ; Compute lowpass filter.  
        filter = 1.0d / (1.0d + (distfun / cutoff)^(2 * order))  
    endif else if (bandtype EQ 1) then begin ; Compute highpass filter.  
        filter = 1.0d / (1.0d + (cutoff / distfun)^(2 * order))  
    endif else begin ; Bandpass or bandreject  
        filter = distfun^2 - cutoff^2 ; Dist squared  
        zeroes = WHERE(abs(filter) EQ 0.0, count)  
        if (count NE 0) then filter[zeroes] = 1d-4 ; Avoid divide by 0  
        filter = 1.0d / (1.0d + $ ; Compute bandreject filter.  
            ((distfun * bandwidth) / filter) ^ (2 * order))  
  
        if (bandtype EQ 2) then $ ; Compute bandpass filter.  
            filter = 1.0 - filter  
    endelse  
end ; of 0
```

If you want to see this code in operation, type "demo" at the IDL prompt. Then select "Signal Processing". You can play around all you like.

Cheers,

David
