I would uninstall any mouse driver and use the standard windows driver.

My Intellimice and an older logitech mouse paired with the standard Win2k "PS/2 Compatible Mouse" driver version 5.0.2183.1 worked w/o problem in 5.6 beta. I haven't received my new 5.6 license yet so I can't verify this for the shipping version :(

I would also report your problems to RSI as a "bug" so a more robust scrolling implementation can be worked on. Same goes for the poster running Solaris, although most on the list will tell you to ditch IDLDE and use IDLWave/Emacs as IDLDE for UN\*X has always been a little sketchy.
