
Subject: XROI in IDL5.6 on MAC OS 10.2?

Can someone out there give XROI a try on IDL5.6 using MAC OS 10.2? Mine fails in several different ways:

XROI,dist(300) gives "Unknown dynamically loadable module: iptool"

XROI by itself brings up a widget, but I get syntax errors in query_image.pro when it gets to QUERY_PNG and QUERY_JPEG, etc.

Perhaps I don't have my path set up properly.

Any advice would be welcome.

I tried this on my Solaris box and got a core dump when I did

```
Data=dist(300)
Data=exp(-data/100)
Data=shift(data,150,150)
Xroi,data
```

Buss error (core dumped)

Other images seemed to work OK.

Thanks for any suggestions.
