
Subject: Plotting to more than one window

Hi all--

I'm trying to plot data alternately, back and forth, to more than one window, and have discovered, to my horror, that OPLOT uses the coordinate conversion parameters for the -last- 'PLOT' procedure, regardless of what the current window you're plotting in happens to be. I can think of various messy and unpleasant ways to get the plotting coordinate parameters I want in the windows I want, when I want them-- but it would be nice if there was a neat and pleasant way to do it-- is there?
