
Subject: dynamically naming variables

Howdy folks,

I was wondering if there was a way to dynamically name a variable in IDL, something like:

```
varnames=['temp1','temp2','temp3']
```

```
for i=0, n_elements(varnames)-1 do begin
```

```
  `varnames[i]`=bytarr(25)
```

```
endfor
```

I would appreciate any help on this, or a way to get around this issue.

Cheers,

-Steve
