Subject: Some kind of paintbucket-function?

Hi experts,

I have images (2D als well as 3D) with a lot of white dots surrounded by a black/dark medium. I want to find all white dots with the MAX-function wich returns only the whitest dot. In my case the dots have a size of more than one pixel, so I need some kind of a paintbucket function (like known in Photoshop) to fill the found dot with black and then search for the next dot in the image.

Is this kind of function available in IDL 5.4? If not, I would greatly appreciate an implementation suggestion since I am new to IDL.

Best regards,

Alex
