I have a huge multiband file (i.e. 4800*2200*150) and I would like to perform a procedure that could write a file with the same dimensions:

1. openr: to open the input file
2. assoc: to extrac some images on which I would like to work
3. replace extracted images in the same place
4. write the output file

My problem is that I can't create a 4800*2200*150 "integer array", because I haven't enought memory.

Is there another way to write file like that?

Thank you

Stéphane
