```

Whoops, this value was actually set to 4 on the version of the program I was testing. Sorry.

I have a dual-monitor set up and `Get_Screen_Size` reports a monitor size of 2560 by 1024.

With `TLB_FRAME_ATTR` set to 4 or 6, the window comes up full-screen on a single monitor. (I think my graphics card is interceding here, because I think I have configured it to do this.)

Oddly, when this value is set to 5, the full-screen window comes up so that it completely fills my primary monitor and half fills the secondary monitor. (!?) I don't know what that could be about. :-(

Cheers,

David
