Dear all,

sometimes I believe using objects is the same kind of question as using word or latex to write a book

I know that I will have perfectly results using latex and that it could be compiled without a gui interface on a lot of platforms and no GUI is necessary to write the chapters. And I know a few years later I can do some changes or some enhancement and then I am able to recompile it.

But if I discuss this with our secretary she has a very different mind about this. She would do all the work in word.

Another object language which I know is Labview. We have several data acquisition programs written in this language. And in difference to idl you are writing the sources with a graphical user interface. This is extremely good designed. Because of programming with icons it is very easy to learn.

If I find an object idl program which is useful for us I like to use it. If it's necessary to do an enhacement I will do this too.

regards

Reimar
