
Subject: Angstrom symbol in IDL5.6

On http://www.dfanning.com/misc_tips/angstrom.html Dave Fanning shows us how to draw an 'Angstrom symbol' (which is of course just the last letter of the alphabet used around here).

Something like:

```
angstrom = '!6!sA!r!u!9 %!n!x'
```

```
XYOUTS, 0.1, 0.5, /Normal, CharSize=5.0, 'Symbol: ' + angstrom
```

But in IDL5.6 this doesn't work so well as in earlier versions: The 'ring' is displaced.

Anything to suggest this is not a genuine bug?
