
Subject: 48 variable limit?

Hi,

I've been given an ASCII file of numbers 50 columns wide
by 6600 rows long, blank-space separated values.

I've tried both `read_ascii` and `readf`, reads and have concluded
that these routines can only read up to 48 variables in a row.

Can anybody confirm this and/or suggest alternatives?

Thanks much,

Shane Mayor
