Here are the steps I used:

1. From SUN Blade terminal, login HP via SSH (IDL was installed on HP)
2. set DISPLAY to SUN's display
3. issue "xhost +" on SUN's terminal
4. start IDL
5. IDL> DEVICE,PSEUDO\_COLOR=8
6. IDL> DEVICE,GET\_VISUAL\_DEPTH=DEPTH;PRINT,DEPTH  
% Unsupported X Windows visual (class: PseudoColor, depth: 8).

Substituting default (class: TrueColor, Depth: 24).

IDL>

I got the same error if I use IDL\_STARTUP file.
