Here are the steps I used:

1. From SUN Blade terminal, login HP via SSH (IDL was installed on HP)
2. set DISPLAY to SUN's display
3. issue "xhost +" on SUN's terminal
4. start IDL
5. IDL> DEVICE,PSEUDO_COLOR=8
6. IDL> DEVICE,GET_VISUAL_DEPTH=DEPTH;PRINT,DEPTH
% Unsupported X Windows visual (class: PseudoColor, depth: 8).
Substituting default (class: TrueColor, Depth: 24).
IDL>

I got the same error if I use IDL_STARTUP file.
