Hello,

I met one probelm on the IDL memory.

I want to plot one 3-D image in the following way,

aaa is a array of (128,128,31)

SHADE_VOLUME, aaa, 0.1, v, p,/low ; up to here, there is no probelm

bbb=POLYSHADE(v,p,/T3D) ;!!!! idl stop here because of the memory.

But If I delte the line of "bbb=POLYSHADE(v,p,/T3D)", run the program,
and use the command of "bbb=POLYSHADE(v,p,/T3D)", strangely it works.

So I do not know what the matter is. Did anyone meet the similar
problem? I would like to get some helos on it.

Thanks very much!

Hong
