This is another candidate question for a FAQ: Since I haven't come across a PostScript previewer that understands the 'colorimage' command, I would like to have the display to the PostScript printer behave EXACTLY like a display on 'X'. My efforts are being foiled by many pitfalls:

- 1) Scalable vs. non-scalable pixels
- 2) background color white vs. black
- 3) size
- 4) fonts

Questions:

- 1) does anybody know of a PostScript previewer that understands 'colorimage'?
- 2) Is there an easy way to create X-windows with automatic white backgrounds and an 'erase' that erases back to white?
