Hello All,

Is there a way to make a slider go in intervals of 5 instead of 1. What I mean is this: when I use a slider in a widget, it displays in intervals of 1. Is there a way that allows me to start with say 5 and end with 100. The second allowable point on the slider is 10, the third 15, the fourth 20 and so on. I know that I can multiply by 5 in the event_procedure but that is not reflected in the slider's label. Any suggestions or recommendations? Thanks.
Karthik.
