At the presentation RSI gave by us, the five people from RSI was not aware of any DLM, call_external restrictions. I specifically asked for that. I think there are restrictions about callable IDL, but let this stand as a rumor rather than a fact. The IDL 6.0 beta documentation does not mention these restrictions. The only serious restriction is the EXECUTE() command, which is not available in VM mode. This seems to be used by many people, even though I haven't discovered its usefulness. (Maybe someone could describe a scenario, where I really need this and cannot find a quick workaround. Maybe I have been missing out on something great here.)

Greetings,
Haje
