Hi all!

I wonder whether someone might have bumped on this problem before and even perhaps have somekind of solution.

As I understand, Postscript files produced by IDL have color coded as RGB. However several (propably most) journals require CMYK-code. I have a clumsy solution, load the file in CorelDraw and make the changes there - this is far from perfect as it among other things usually require many trials e.g., going back to IDL for changing the line thicknesses and such.

So has anyone a better solution?

Our IDL environment is 'IDL Version 5.6, Compaq Tru64 (OSF alpha m64)'  
Also Linux and even Windows based solutions would be OK.

Cheers,

EsaR

PS. I think provision of CMYK-coded PS would be much needed in the future IDL-versions.
