
Subject: Send images through ION

Hi all,

Here's the situation. I have a Java applet running on the client. In this applet, images will be selected and stored within the client side applet. Using ION, I need to process these images. However, I'm having difficulty finding a way to send these images to the ION server.

In all the ION examples I have seen, images are assumed to be stored on the ION server. Is there a way to send the images through ION to be processed? Or do the images have to be sent to the server through Java into a temp directory which can then be processed by ION.

Thanks.
