Subject: IDL 5.6 + Mac OS X using X11 + sockets

I would like to use "sockets" to send receive data via tcp/ip. I have
been successful doing this in Windows but having difficulty setting it
up in OS X. I was wondering if there is anyone else out there on Mac
OS X who have been successful in getting sockets to work. Since I am
in an x-windows environment I am wondering if there are extra settings
I need to do for it to work.

Thanks,
Catherine
