Hi folks!

Sorry to trouble u again....but envi seems to be just going above my head...there is another problem that i am facing:

Please go through the 2 functions:

```
1.function example,b1
```

```
  help,b1
```

```
end
```

```
2.function example,b1,b2
```

```
  help,b1
```

```
end
```

Now could anyone tell me why these 2 codes are producing different final answers??? I just cant find any reason for it.

One more problem :

'b1' is a positive array and 'avgb1' is a positive number but when i use the formula : $\text{result} = b1 * 100 / \text{avgb1}$

```
  print, result
```

, the answer that i get is a negative array.

Whereas if i use the formula : $\text{result} = b1 / \text{avgb1}$

```
  print, result * 100
```

, then i get a positive array

I hope to hear the answers to these questions soon. Thnxx

Byee
