Hi!
 I have this strange problem...i have written one band math function
to print the band value at the location 30,30 but it doesnt work. And
the same function if written for location 4,4 ...works fine! Here are
the functions:

```
1.function example,b1
  help,b1
  print,b1(30,30)
  end
2.function example,b1
  help,b1
  print,b1(4,4)
  end
```
     And strangely enuf...in the second example, the value b1(4,4)
is printed   4 times & the value printed final time is the right
value. The help command outputs that the array is of size[5,5] in the
initial 3 times. Only after that in the final turn does it output the
right dimesnions that is 608*673

Could anyone please enlighten me....it has been bugging me for many
days!
Thnx in advance

Gaurav
