OK, fixed now, I think. I won't go into particulars, except to say that you should NEVER publish a piece of software that is your first attempt at something new no matter HOW spectacular you feel about it when you are finished. :-(

Let's just say I have obviously come a long way in object programming in the past three years. :-)

But, of course, now that Pepijn has opened the flood gates, all kinds of reports are coming in. I've heard that fonts are a problem on some systems. This, I can well believe. Martin Shultz, for whom this program was written originally, added some font strings over my vociferous (but not vauriferous enough, apparently) objections. They were intended, I think, for his personal version of Linux.

I'll see about taking them out, but I didn't really mean to get involved in this today, at all, and I really HAVE to get something else done first!

If you don't have font problems and you just couldn't get the XAXIS stuff to appear, you can download these files:

http://www.dfanning.com/mpi_plot.zip

Otherwise, keep those cards and letters pouring in. It's gratifying to know that *somebody* uses this stuff occasionally. :-)

Cheers,

David

P.S. I worked about 20 of the past 24 hours on getting my Catalyst Library ready to go for the new IDL Virtual Machine. Let's just say, if you think MPI_PLOT was neat, you are going to LOVE CATPLOT! :-)
